## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Foreground/Background segmentation of color images by integration of multiple cues, by Huang et al in view of Weinholz et al (US 6707939).

Art Unit: 2623

With respect to claim 1, Huang discloses a method for clustering the images, once a feature is extracted from the segmented images, and depending upon the similarities of the segments getting the foreground and background, (see page 246, col. 2, page 247, col. 1) as claimed. However, he fails to disclose dividing into different regions, as claimed. Weinholz teaches dividing an image into different blocks in order to classify the images into foreground and background, (see col. 5, lines 28-37) as claimed. Two references are combinable as they are analogous because they are solving similar problem of clustering the images. The division of an image into blocks or the segmentation of the image prior to clustering the image will reduce the time for clustering or classifying because the division of image into blocks make the image data smaller and the time taken to computer a smaller data is less than time taken to compute a larger data.

With respect to claim 2 and 3, Huang further discloses generating distance measure and predetermined size of the regions, (see page 247, section 2 the color clustering depends upon the number of color in the image "predetermined size" and the "distance measure" is the difference in the color) as claimed.

With respect to claim 4 and 5, Huang further discloses the comparison between the images in order to get the clustering, (see page 247, section 2 and 3) as claimed.

Claim 6 is rejected for the same reasons as set forth in the claim 1, because claim 6 is claiming software for the method claim 1.

Art Unit: 2623

Claims 7-19 is rejected for the same reasons as set forth in the rejection of claims 1-6, because claims 7-19 are different combination of the subject matter claimed in claims 1-6.
